

SBH - Study Buddy Hub - MERN STACK PROJECT

🇮🇹 Se si utilizza la app di prova on line e si riscontrano dei ritardi nella risposta al primo accesso aspettare 1 minuto e riprovare probabilmente il server di render.com gratuito e' andato in sleep mode pochi secondi e dovrebbe partire alla prima richiesta ricevuta

Questa è la documentazione GENERALE del progetto , nelle sottocartelle front e back si troveranno le documentazioni dettagliate per il back end ed il front end. menter nella versione

[/assets/documentation.pdf](#) e [/assets/documentation.md](#) si trovano i 3 readme generale,back-end e front-end tutti insieme uno sotto l'altro.

🇬🇧 If you use the online test app and experience delays in the response at the first login, wait 5 minutes and try again, probably the free render.com server went into sleep mode for a few seconds and should start at the first request received

Try Now!

[StudyBuddyHub](#)

Tools

Why

This project is the final MERN project for start2impact full stack developer master course.

General

🇮🇹 La richiesta principale dell'esercizio era sviluppare l'autenticazione al sistema e la registrazione utente inoltre bisognava dare qualche funzionalita a piacere . Ispirato da quest'ultimi anni di studio e dagli obiettivi onu a cui a sua volta si ispira s2i e dalle persone conosciute in questa avventura ho voluto fare qualcosa che stimolasse lo studio di gruppo visto che io in prima persona e ho visto tanti altri dopo di me soprattutto all'inizio di un corso si trovano molto propensi allo studio di gruppo , lanciano qualche richiesta sul discord ma non sempre e' facile coordinare le tempistiche ma secondo me e' un esigenza servizio che potrebbe riempire questa piccola lacuna , supportare nell'incontro e nella creazione di piccoli gruppi studio. seguiranno ulteriori dettagli

🇬🇧 The main request of the exercise was to develop system authentication and user registration and it was also necessary to provide some functionality as desired. Inspired by these last years of intense study and by the UN objectives which in turn inspire s2i and by the people I met in this adventure, I wanted to do something that stimulated group study since I personally and I have seen many others afterwards of me,

especially at the beginning of a course, they find themselves very inclined towards group study, they launch some requests on the discord but it is not always easy to coordinate the timing but in my opinion it is a need for a service that could fill this small gap, support in ' meeting and creating small study groups. further details will follow

Principal Functions

-Gli utenti possono iscriversi o essere fondatori di tre gruppi al massimo contemporaneamente -Gli utenti possono creare un gruppo studio solo se prima scelgono un corso su cui appoggiare il gruppo. -Un partecipante ad un gruppo puo' accedere alla chat privata del gruppo. -Un utente puo' cancellarsi da un gruppo e se e' il fondatore eliminare il gruppo. -Solo gli admin possono acceder alla Admin Panel per creare Scuole, Master e Corsi su cui gli utenti potranno appoggiare i loro gruppi studio

-Login tramite mail e password -Sign up che crea la scheda utente ma in stato Pending. poi manda una email che poi andra' aperta e cliccato il link di conferma per rendere l'account Active -Funzione di Forgot password che mandera' una mail con link che ha validita' 10 minuti per eventuale cambio password.

Users can join or be founders of up to three groups at the same time -Users can create a study group only if they first choose a course on which to base the group. -A participant in a group can access the group's private chat. -A user can unsubscribe from a group and if he is the founder delete the group. -Only admins can access the Admin Panel to create Schools, Masters and Courses on which users can support their study groups

-Login via email and password

- Sign up which creates the user card but in Pending status sends an email which will then be opened and the confirmation link must be clicked to make the account Active -Forgot password function which will send an email with a link valid for 10 minutes for any password change.

General Architecture

Il back end e' basato su NODE-JS ed EXPRESS per la gestione del server , utilizziamo MONGOOSE per aiutarci a gestire il database MONGO-DB. Il front end e' sviluppato in React con diverse librerie , fra le principali cito ReactQuery(tenstackquery) ed Axios per la gestione delle fetch , context api e reducer per la gestione degli stati, Cookies e Jwt token per la gestione delle autorizzazioni. Tailwind e' la scelta principale per la gestione dello stile.

The back end is based on NODE-JS and EXPRESS for server management, we use MONGOOSE to help us manage the MONGO-DB database. The front end is developed in React with various libraries, the main ones being ReactQuery (tenstackquery) and Axios for managing fetches, context api and reducer for managing states, Cookies and Jwt tokens for managing authorizations. Tailwind is the leading choice for style management.

Security

🇮🇹 La sicurezza per l'accesso e' gestita con token JWT / HTTP ONLY COOKIES per l'autorizzazione principale alle api. La password viene registrata sul database encryptata.(bcrypt). Invece i token di conferma account e cambio password scordata visto che sono temporanei e gia' spediti via mail ho deciso per questo progetto di lasciarli solo bcrptati senza gestione jwt. C'e un controllo quindi sia lato back end che front end sull'autorizzazione solo gli utenti loggati possono vedere alcuni parti del menu front end ma per molte operazioni sensibili il controllo viene effettuato anche lato back. Una volta registrato un nuovo utente sara' in "status : pending" finche' non clicchera' il link di autorizzazione nella mail ricevuta sull'indirizzo di registrazione. Una volta cliccato sul link lo stato diventera' "Active". I tokens con il link di conferma via mail dopo la registrazione e anche quello per il cambio passowrd provvisorio (che ha validita- di 10 minuti) hanno solo uno livello di crypting con Bcrypt ma non sono jwt come il gettone principale di autenticazione.

Avevo per motivi di studio anche implementato l'accesso tramite "google auth" ed in locale funziona con alcune limitazioni per esempio 100 indirizzi di "test" massimo che possono interagire col progetto , e con notifica aggiuntiva di google che l'app non 'e sicura seguendo queste info per chi fosse interessato ad approfondire : [Google OAuth2](#). In locale funziona bene , e fa riferimento a localhost:4000 (nel mio caso), invece per renderlo operativo con i siti dove ho deployato il back end ed il front end al momento mi e' impossibile , perche' google richiede solo domini di primo livello e SSL e https , cosa che al momento mi e' impossibile o molto difficile gratuitamente . Anche usando servizi di reindirizzamento serve montare un server Linux per esempio che faccia il reindirizzamento.

🇬🇧 Access security is managed with a JWT token. The password is recorded in the encrypted database. However, since the account confirmation and forgotten password change tokens are temporary and already sent via email, for this project I decided to leave them only bcrptated without jwt management. There is therefore a control on both the back end and front end on the authorization only logged in users can see some parts of the front end menu but for many sensitive operations the control is also carried out on the back side. Once registered, a new user will be in "status: pending" until they click the authorization link in the email received on the registration address. Once you click on the link the status will become "Active". The tokens with the confirmation link via email after registration and also the one for the temporary password change (which is valid for 10 minutes) only have one level of encryption with Bcrypt but are not jwt like the main authentication token.

For study reasons I had also implemented access via "google auth" and locally it works with some limitations for example 100 maximum "test" addresses that can interact with the project, and with additional notification from Google that the app is not secure by following this info for those interested in learning more: [Google OAuth2](#). Locally it works well, and refers to localhost:4000 (in my case), however it is impossible for me to make it operational with the sites where I have deployed the back end and the front end at the moment, because Google only requires first domains level and SSL and https, which at the moment is impossible or very difficult for me for free. Even using redirection services you need to set up a Linux server for example that does the redirection.

```
### :triangular_flag_on_post: Note

:it:
Per leggere i campi dipendenti da altre' entita' ricordarsi di usare "populate"
come in questo estratto del progetto :
```

:uk:

To read fields dependent on other entities, remember to use "populate" as in this project excerpt:

```
{ const populateOptions = [ { path: 'school', select: 'name' }, { path: 'master', select: 'name' }, { path: 'course',
select: 'name' }, { path: 'participants.user', select: 'userName' }, // Aggiunta per popolare i partecipanti { path:
'founder', select: 'userName' }, // Aggiunta per popolare i partecipanti ];

}
```

Chat

🇮🇹 la chat funziona di base con dei socket in ascolto sul server. la chat e' in tempo reale ma viene anche registrata sul database in un campo relativo ad ogni gruppo di studio essendo una funziona sperimentale e non oggetto principale del progetto scolastico in essere non entro nei particolari qui nella documentazione ma rimango a disposizione nei contatti in calce per ulteriori info

:ukn: the chat basically works with sockets listening on the server. the chat is in real time but is also recorded on the database in a field relating to each study group

Since it is an experimental function and not the main object of the existing school project, I will not go into detail here in the documentation but I remain at your disposal with the contacts at the bottom for further information

IDEAS

🇮🇹 Il progetto potrebbe avere anche una gestione delle foto profilo ma diventava una scelta da gestire che complicava ancora il progetto , quindi ho fatto un po' di ricerche ma per il momento ho voluto sorvolare. In futuro si potrebbero implementare dei punteggi bonus / malus , che si ottengono da gli altri utenti del gruppo magari in base alla frequenza nel gruppo o altri fattori, si potrebbe cosi decidere se entrare o fare entrare qualcuno nel gruppo con una bassa reputazione. Si potrebbe aggiungere un controllo su quando qualcuno o tutti nel gruppo superano l'esame relativo con punti o badge dedicati.

Si potrebbe pensare di monetizzare in almeno 3 modi:

- funzioni aggiuntive per gli utenti premium , per esempio adesso il numero massimo di gruppi contemporanei e' 3, si potrebbe rendere piu alto o manipolare questo numero dietro un abbonamento premium (occasione per approfondire e testare Stripe o altre librerie per i pagamenti reali) o per esempio rendere il fatto di creare piu' di un gruppo una funzione premium invece iscriversi una funzione free ecc ecc
- gestione dei tutor , utenti esperti che abbiano dimostrato frequenza costanza ed affidabilita' coi punteggi e badge interni, una volta completato un master per esempio potrebbero diventare Tutor, essere scelti da un gruppo che andranno a seguire e che paghera' una somma extra che andra' al tutor ed in percentuale al sito
- servizio esterno per le scuole , una scuola per inserirsi nell'elenco e aggiungerne i suoi master ed i suoi corsi dovrebbe pagare una somma annuale al sito , ed aggiungere cosi un servizio molto fidelizzante

fra quelli proposti ... in questo caso si potrebbe escludere dalla vista dell'user la scelta delle altre scuole per esempio.

 The project could also have profile photo management but it became a choice to manage which further complicated the project, so I did a bit of research but for the moment I wanted to ignore it. In the future, bonus/malus scores could be implemented, which are obtained from other users in the group, perhaps based on frequency in the group or other factors, so it could be decided whether to enter or have someone with a low reputation join the group. You could add a check on when someone or everyone in the group passes the relevant exam with dedicated points or badges.

You could think of monetizing in at least 3 ways:

- additional functions for premium users, for example now the maximum number of simultaneous groups is 3, this number could be made higher or manipulated behind a premium subscription (an opportunity to delve deeper and test Stripe or other libraries for real payments) or for example, making the fact of creating more than one group a premium function instead of signing up a free function etc etc
- management of tutors, expert users who have demonstrated frequency, consistency and reliability with internal scores and badges, for example once they have completed a master's degree they could become tutors, be chosen by a group that they will follow and who will pay an extra sum which will ' to the tutor and in percentage to the site
- external service for schools, for a school to be included in the list and add its masters and courses it would have to pay an annual sum to the site, and thus add a very loyalty-building service among those offered... in this case it could be excluded from the user's view the choice of other schools for example.

External Service

 Per il database come già detto utilizzo il servizio base di Cloud di [MongoDb](#) Per il deploy del backend il servizio gratuito base di [render.com](#) Per il deploy del frontend il servizio gratuito base di [netlify.com](#) Per il servizio di mail transictional il servizio base gratuito di [brevo.com](#) Per il servizio di mail usato in developoment local mode il servizio gratuito base [mailtrap.io](#)

 For the database, as already mentioned, I use the basic Cloud service of [MongoDb](#) For the deployment of the backend the free basic service of [render.com](#) For the deployment of the frontend the free basic service of [netlify.com](#) For the transitional email service, the free basic service of [brevo.com](#) For the email service used in local development mode, the free basic service [mailtrap.io](#)

if you want to immediately test the endpoints use this link for the test response from browser or with a GET:

[test backend](#)

if you want to immediately see the site : [test frontend](#)

Installation

First of all, you need Node.js installed. If you don't have it, you can download it here: [Node.js](#) After the installation, you're ready to go. you will find instructions for local installation or deployment both in the \front and \back folders in the readme.md relating to the front-end and back-end in detail.

SBH - Study Buddy Hub - BACK END

SBH - Study Buddy Hub - BACK END

Questa è la documentazione BACK END del progetto , nella root la documentazione generale e nella cartella front la documentazione FRONT END

This is the BACK documentation of the project, in the main folder the GENERAL doc and in front folder the FRONT END doc.

API - Main endpoints

 il back end e' in grado di gestire altri endpoint ma al momento spiego l'utilizzo di quelli utilizzati nel front end

 the back end is able to manage many other endpoints but at the moment I will explain the use of those used in the front end for what is needed for the project.

General

La **root** sara' per esempio

localhost:3005 (se il server e' in ascolto come nel mio caso sulla porta 3005)

oppure il il dominio che ospita il server on line nel nostro caso

<https://s2i-study-buddy-hub-4coach.onrender.com/>.

Le rotte principali sono 5:

For example, the **root** will be

localhost:3005 (if the server is listening on port 3005 as in my case)

or the domain that hosts the online server in our case

> **<https://s2i-study-buddy-hub-4coach.onrender.com/>**.

**/test
 /api/v1/users
 /api/v1/schools
 /api/v1/masters
 /api/v1/courses
 /api/v1/groups`**

/test

 La prima rotta e' molto semplice facendo una **GET** rispondera' con 200 SUCCESS quando il server e' on line . la rotta e' pubblica (le rotte pubbliche sono comunque gestite dal limiter per evitare abusi).

 The first route is very simple doing a **GET** will respond with 200 SUCCESS when the server is online. the route is public (public routes are however managed by the limiter to avoid abuse).

/users

 La seconda rotta principale **user** contiene :

 The second main route **user** contains :

```
{  
  
  // THIS ROUTES ARE NOT PROTECT  
  GET    - users/confirmAccount/:activeToken  
  POST   - users/signup  
  POST   - users/login  
  GET    - users/forgotPassword  
  PATCH  - users/resetPassword/:token  
  
  // THIS ROUTE IS PROTECT ONLY WITH JWT IN HEADERS REQ (bearer token)  
  GET    - users/validateToken  
  
}
```

GET - users/confirmAccount/:activeToken

The active token is the link received in the confirmation email after the signup.

For 200 SUCCESS case received the JWT token and activate the account from "Pending" to "Active" state in the database.

POST - users/signup

body req:{password:string(min 8) , passwordConfirm(equal to password) ,
userName:string(min3,max30), email:string-valid-format-Email-Address}

For 200 SUCCESS case receive the email for Activate the account

POST - users/login

body req:{password:string(min 8) ,email:string-valid-format-Email-Address}

For 200 SUCCESS case receive the JWT token for access the site app.

POST - users/forgotPassword

body req:{email:string-valid-format-Email-Address}

For 200 SUCCESS case receive the email with the temporary link for change the password.

PATCH- users/resetPassword:token

the token is the token in the link received via mail after the "forget password request" **body req:**
`{password:string(min8),passwordConfirm(string equal to password field)}`

For 200 SUCCESS case receive set the new password in the database.

GET - users/validateToken

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

body req:`{password:string(min8),passwordConfirm(string equal to password field)}`
header: `jwt bearer token`

For 200 SUCCESS case receive the object with the user details:

Here a response example

```
{
  status: 'success',
  message: 'Token is valid',
  userName: "claudio dallara",
  email: "claudiodallara77@gmail.com"
  role: "user"
  _id: 55556545d54s5d45,
}
```

/schools

 il prossimo endpoint e' /schools . e' un endpoint protetto, bisogna sempre mettere jwt come bearer token nell'headere della richiesta. possono accedere solo gli admin al POST , possono accedere tutti al GET  the next endpoint is /schools.it is a protected endpoint, you must always put jwt as a bearer token in the request header. Only admins can access POST, everyone can access GET

GET - schools/

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

For 200 SUCCESS case receive the object data whit an array of the groups details:

Here a response example :

```
{
  status: 'succes',
  results: doc.length,
  data: { data: doc },
}
```

```
requestedAt: req.requestTime,  
}
```

POST - schools/

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.
This endpoint is for create a new schools, PROTECT only for "admin"

body req:{name:string,site:valid-email-format}}
header: jwt bearer token

For 200 SUCCESS case cerate a new school in database and receive the new object create

/schools

 il prossimo endpoint e' /schools . e' un endpoint protetto, bisogna sempre mettere jwt come bearer token nell'headere della richiesta. possono accedere solo gli admin al POST , possono accedere tutti al GET  the next endpoint is /schools.it is a protected endpoint, you must always put jwt as a bearer token in the request header. Only admins can access POST, everyone can access GET

GET - /schools

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

For 200 SUCCESS case receive the object data with an array of the groups details:

Here a response example :

```
{  
  status: 'succes',  
  results: doc.length,  
  data: { data: doc },  
  requestedAt: req.requestTime,  
}
```

POST - /schools

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.
This endpoint is for create a new schools, PROTECT only for "admin"

body req:{name:string,site:valid-email-format}}
header: jwt bearer token

For 200 SUCCESS case create a new school in database and receive the new object create

/masters

 the next endpoint is /masters is a protected endpoint, you must always put jwt as a bearer token in the request header. Only admins can access POST, everyone can access GET

GET - /masters

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

For 200 SUCCESS case receive the object data with an array of the masters details:

Here a response example :

```
{
  status: 'succes',
  results: doc.length,
  data: { data: doc },
  requestedAt: req.requestTime,
}
```

POST - /masters

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

This endpoint is for create a new master, PROTECT only for "admin"

the relevant school to insert is the index `_id` of the home school to be taken from the "schools" table

body req:{name:string,school:objectId}

header: jwt bearer token

For 200 SUCCESS case create a new master in database and receive the new object create

/courses

 the next endpoint is /course is a protected endpoint, you must always put jwt as a bearer token in the request header. Only admins can access POST, everyone can access GET

GET - /courses

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

For 200 SUCCESS case receive the object data with an array of the courses details:

Here a response example :

```
{
  status: 'succes',
  results: doc.length,
  data: { data: doc },
  requestedAt: req.requestTime,
}
```

POST - /courses

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.
This endpoint is for create a new master, PROTECT only for "admin"
the relevant school to insert is the index `_id` of the home school to be taken from the "schools" table the
relevant master to insert is the index `_id` of the home master to be taken from the "masters" table

```
body req:{name:string,school:objectId},master:objectId}}
header: jwt bearer token
```

For 200 SUCCESS case create a new course in database and receive the new object create

/groups

 the next endpoint is /groups is a protected endpoint, you must always put jwt as a bearer token in the request header. Everyone (use,admin,mod ecc)can access GET and POST.

GET - /groups

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

For 200 SUCCESS case receive the object data with an array of the groups details:

Here a response example :

```
{
  status: 'succes',
  results: doc.length,
  data: { data: doc },
  requestedAt: req.requestTime,
}
```

POST - /courses

This endpoint is referred to with a get and putting req in the heder. as bearer token the authorization jwt.

This endpoint is for create a new group

the relevant school to insert is the index `_id` of the home school to be taken from the "schools" table the
relevant master to insert is the index `_id` of the home master to be taken from the "masters" table the
relevant course to insert is the index `_id` of the home course to be taken from the "courses" table

```
body req:{name:string,school:objectId,master:objectId,course:objectId}
header: jwt bearer token
```

For 200 SUCCESS case create a new group in database (the founder is the user who create the group)and
receive the new object create

Other Endpoint

 ci sono altri endpoint pronti nel backend come per esempio, il `getOne` per le scuole/master/corsi/gruppi,
il `deleteMe` , `getMe` per l'user, il cambio password ma da loggati ed altro ... ma visto che non sono sviluppati
sul front end del progetto sorvolo

🇬🇧 there are other endpoints ready in the backend such as, for example, `getOne` for `schools/masters/courses/groups`, `deleteMe`, `getMe` for the user, changing password but when logged in and more... but since they are not developed on the front end of the flyover project

DataBase MONGO DB MONGOOSE

Il database e' sviluppato in MongoDB con servizio cloud integrato.

The database is developed in MongoDB with integrated cloud service. There are 5 main tables : -User - Group -Course -Master -School

SCHOOL SCHEMA (MONGOOSE) :

```
{
  name: {
    type: String,
    required: true,
    unique: true,
  },
  site: {
    type: mongoose.SchemaTypes.Url,
  }
}
```

MASTER SCHEMA (MONGOOSE) :

```
{
  name: {
    type: String,
    required: true,
  },
  school: {
    type: mongoose.Schema.ObjectId,
    ref: 'School',
    required: [true, 'Course must belong to a school.'],
  }
}
```

COURSE SCHEMA (MONGOOSE) :

```
{
  name: {
    type: String,
    required: true,
  },
}
```

```
master: {
  type: mongoose.Schema.ObjectId,
  ref: 'Master',
  required: [true, 'Course must belong to a master.'],
},
school: {
  type: mongoose.Schema.ObjectId,
  ref: 'School',
  required: [true, 'Course must belong to a school.'],
},
}
```

GROUP SCHEMA (MONGOOSE):

```
{
  name: {
    type: String,
    required: [true, 'Group must have a name'],
    unique: true,
    index: true, // altrimenti unique non funziona
  },
  course: {
    type: mongoose.Schema.ObjectId,
    ref: 'Course',
    required: [true, 'Group must refer to a course'],
  },
  master: {
    type: mongoose.Schema.ObjectId,
    ref: 'Master',
    required: [true, 'Group must refer to a master'],
  },
  school: {
    type: mongoose.Schema.ObjectId,
    ref: 'School',
    required: [true, 'Group must refer to a school'],
  },
  founder: {
    type: mongoose.Schema.ObjectId,
    ref: 'User',
    required: [true, 'Group must refer to a founder'],
  },
  participants: [
    {
      user: {
        type: mongoose.Schema.ObjectId,
        ref: 'User',
      },
      dateStart: { type: Date, default: Date.now() },
      dateEnd: { type: Date, default: null },
    },
  ],
}
```

```
],

maxParticipants: {
  type: Number,
  default: 2,
},
currentParticipantsNumber: {
  type: Number,
  virtual: true,
  get: function () {
    return this.participants.length;
  },
},
chat: [
  {
    user: {
      type: String,
      required: [true, 'Chat message must have a user'],
    },
    message: {
      type: String,
      required: [true, 'Chat message must have a message'],
    },
    date: {
      type: Date,
      default: Date.now,
      required: [true, 'Chat message must have a date'],
    },
  },
],
]
```

USER SCHEMA (MONGOOSE) :

```
{
  userName: {
    type: String,
    required: [true, 'A user must have a name'],
    minlength: 3,
    maxlength: 30,
  },
  email: {
    type: String,
    required: [true, 'Please provide email'],
    unique: true,
    lowercase: true,
    validate: [validator.isEmail, 'Please provide a valid email'],
  },
  role: {
    type: String,
    enum: ['user', 'mod', 'admin', 'tutor'],
  },
}
```

```

    default: 'user',
  },
  password: {
    type: String,
    required: [true, 'Please provide a password'],
    minlength: 8,
    select: false,
  },
  passwordConfirm: {
    type: String,
    required: [true, 'Please provide a confirm password'],
    validate: {
      // This only works on CREATE and SAVE !!!
      validator: function (el) {
        return el === this.password;
      },
      message: 'Passwords are not the same!',
    },
  },

  select: false,
},
passwordChangedAt: {
  type: Date,
  select: false,
},
passwordResetToken: {
  type: String,
  select: false,
},
passwordResetExpires: {
  type: Date,
  select: false,
},
activeToken: {
  type: String,
  select: false,
},
status: {
  type: String,
  enum: ['Pending', 'Active', 'Ban'],
  default: 'Pending',
}
}

```

:dart: Settings for env file e Render.com

:it:

Per semplicità ho aggiunto un file `config.fake` dovrebbe servire per semplificare la stesura del file stesso in locale o nel modo in cui si settano le variabili d'ambiente nel sistema di deploy scelto. Nel mio caso su render si può caricare un file intero con copia incolla del suo contenuto (prima tolgo le righe commentate) ed in una sola copia incolla si riescono a caricare tutte le variabili d'ambiente altrimenti si possono caricare una alla volta.

:uk:

For simplicity I added a `config.fake` file which should serve to simplify the drafting of the file itself locally or in the way in which the environment variables are set in the chosen deployment system. In my case on render you can load an entire file with copy and paste of its contents (first I remove the commented lines) and in a single copy and paste you can create all the environment variables otherwise they can be loaded one at a time.

```

```

:it:

Per il settings del progetto Render.com ci chiederà di scegliere una repo da Github, nel nostro progetto indicheremo la cartella back perché il link della repo punta all'intero progetto invece noi vogliamo scendere nella cartella `back`.

Il progetto è da lasciare così come è sarà cura di Render.com creare la build, e poi deployare e lanciare il server.

Inoltre attenzione ad inserire come build command "yarn" e come start command `node server.js` nel mio caso o il file principale del back in generale.

Scegliamo yarn anche se in locale usiamo npm perché render funziona meglio così per node.js.

:uk:

For the project settings Render.com will ask us to choose a repo from Github, in our project we will indicate the back folder because the repo link points to the entire project instead we want to go to the `back` folder.

Also be careful to insert "yarn" as the build command and `node server.js` as the start command in my case or the main back file in general.

We choose yarn even if we use npm locally because render works better this way for node.js.

```

```

```

```

:it:

La variabile NODE_ENV è impostata su development nell'esempio questo vuol dire che punterà al frontend locale impostato su localhost:4000.

Se si vuole puntare al front end di produzione in questo progetto <https://studybuddyhub.netlify.app> allora commentare la riga # NODE_ENV=development e togliere il commento # alla riga NODE_ENV=production.

Per lavorare su server locale far partire il programma da locale ricordarsi di coordinare il frontend in tal caso .

Altra differenza in cui incide la variabile NODE_ENV e' che se in production allora usa il servizio di BREVO e manda mail reali se invece in development utilizza il servizio fittizio di MAILTRAP.

:uk:

The NODE_ENV variable is set to development in the example, this means that it will point to the local frontend set to localhost:4000.

If you want to point to the production front end in this project <https://studybuddyhub.netlify.app> then comment out the line # NODE_ENV=development and uncomment # the line NODE_ENV=production.

To work on a local server, start the program locally, remember to coordinate the frontend in this case.

Another difference affected by the NODE_ENV variable is that if in production it uses the BREVO service and sends real emails while in development it uses the fictitious MAILTRAP service.

```
{ # NODE_ENV=production NODE_ENV=development
```

```
# PORT SETTING
PORT=3005

# NODE VERSION IMPORTANT FOR SETTING
# RENDER ON COM DEVELOP
NODE_VERSION=18.17.1

:it:
Ho voluto provare anche a gestire una chat. Ho scoperto l'utilizzo dei socket ed
ho iniziato a sperimentare un po' ... il file principale che gestisce la chat e'
socketManager.js

:uk:
I also wanted to try managing a chat. I discovered the use of sockets and started
experimenting a bit... the main file that manages the chat is socketManager.js

## :floppy_disk: Installation

:it:
Prima di tutto, è necessario che Node.js sia installato.
Se non ce l'hai puoi scaricarlo qui:
[Node.js](https://nodejs.org/it/download/)
Dopo l'installazione, sei pronto per partire.

:uk:
First of all, you need Node.js installed.
If you don't have it, you can download it here:
[Node.js](https://nodejs.org/it/download/)
After the installation, you're ready to go.

### 1 - Clone the repository

`git clone https://github.com/boobaGreen/S2I-STUDY_BUDDY_HUB_4COACH`

IMPORTANT!! - NOW go to the FOLDER "back" :
`cd back`

### 2 - Install the dependencies

REMEBER: we are in the "back" folder now!

`npm install`
```

3 - Setting the config.env file

:it:

Sopra abbiamo già elencato tutte le variabili d'ambiente da impostare. Ricordo di lasciare decommentata la modalità desiderata se sviluppo punterà al front end locale e utilizzerà "mailtrap" di default, se produzione allora punterà al front end indicato come web e utilizzerà "brevo" per inviare email vere e proprie

:uk:

Above we have already listed all the environment variables to be set. I remember to leave the desired mode uncommented if development will point to the local front end and will use "mailtrap" by default, if production then it will point to the front end indicated as web and will use "brevo" to send real emails

```
{ # NODE_ENV=production NODE_ENV=development }
```

4 - Start it

add this scripts at your "package.json" file :

```
"scripts": { "start": "SET NODE_ENV=development&&nodemon server.js", "start:prod": "SET NODE_ENV=production&&nodemon server.js", },
```

```
`npm start` - start in DEV mode default (error's message are set for developers)  
`npm start:prod` - start in PROD mode (error's messages are set for clients)
```

SBH - Study Buddy Hub - Front End

Questa è la documentazione di FronEnd React per un progetto MERN più ampio.

This is the FronEnd React Documentation for a larger MERN project.

? Why

This project is the final MERN project for start2impact full stack developer master course.

💡 How it Works

🇮🇹 La app avra' una Cover che e' la "Home page" quando non si e' loggati. Le altre voci del menu per i non loggati saranno "Sign Up", "Login" ed "About" che e' l'unica pagina tra queste insieme a "Page Not Found" per i path non gestiti che saranno uguali per gli utenti autenficati e no. Il menu per gli utenti autenticati invece sara' "Home"(dove si gestiranno i gruppi studio a cui si e' iscritti), "Groups" dove si potra creare un nuovo gruppo ed iscriversi ad altri oltre che navigare fra i gruppi.Ci sara' la pagina "About" che come gia' detto sara' l'unica (se non consideriamo "Page not found")accessibile allo stesso modo da utenti autenticati o no.Ci sara' ovviamente la pagina per il "Logout" ed infine solo per utenti "admin" un pannello per creare nuove scuole , master e corsi a cui i gruppi faranno riferimento.

en: The app will have a Cover which is the "Home page" when you are not logged in. The other menu items for non-logged in users will be "Sign Up", "Login" and "About" which is the only page among these together with "Page Not Found" for unmanaged paths which will be the same for authenticated users and no. The menu for authenticated users will instead be "Home" (where you will manage the study groups you have signed up to), "Groups" where you can create a new group and subscribe to others as well as navigate between the groups. There will be ' the "About" page which, as already mentioned, will be the only one if we do not consider "Page not found" accessible in the same way by authenticated or non-authenticated users. There will obviously be the "Logout" page and finally only for users "admin" a panel to create new schools, masters and courses to which the groups will refer.

:: ScreenShot

🇮🇹 la app oltre alla gestione dell'autenticazione piuttosto complessa lato gestione ma che in realta' non richiede un manuale per l utente particolare...ha il resto dell'app e' appena accennata, idee per renderla piu completa e complessa nel readme del progetto principale nella root folder.

🇬🇧 the app in addition to the rather complex authentication management on the management side but which in reality does not require a manual for the particular user... the rest of the app is just mentioned, ideas to make it more complete and complex in the project readme root in the root folder.

Example screenshot>

🎨 Styles

🇮🇹 Per Gestire lo stile ho usato Tailwind. Lo stile e' volutamente molto semplice ma ho voluto cercare di rendere il codice leggibile senza astrarre troppo . Ho quindi creato Elementi riutilizzabili alcuni anche personalizzabili , ed ho usato comunque una serie di variabili colore di base personalizzati per rendere piu veloce possibile eventual cambiamenti futuri , la tabella si trova nel file `index.css` nella root. Le mediaquery sono molto semplici ed anche il menu' principale diventa a scomparsa in caso di schermo piccoli.

:en: To manage the style I used Tailwind. The style is deliberately very simple but I wanted to try to make the code readable without abstracting too much. I therefore created reusable elements, some of which were also customizable, and I still used a series of customized basic color variables to make any future changes as fast as possible, the table is found in the index.css file in the root. The media queries are very simple and even the main menu disappears on small screens.

Dependencies

spiegazione delle librerie usate per scopo:  explanation of libraries used for purpose:

general react

```
"react": "^18.2.0" "react-dom": "^18.2.0" "react-router-dom": "^6.18.0"
```

fetching

```
For react query and axios settings "@tanstack/react-query": "^5.17.19", "@tanstack/react-query-devtools":  
"^5.17.21" "axios": "^1.6.1"
```

Jwt Token and http only cookies

```
"js-cookie": "^3.0.5", "jsonwebtoken": "^9.0.2"
```

form

```
"react-hook-form": "^7.48.2", "@hookform/resolvers": "^3.3.2", "yup": "^1.3.2"
```

toggle dark mode

```
"react-dark-mode-toggle": "^0.2.0"
```

icons

```
"react-icons": "^4.11.0"
```

spinners

```
"react-loader-spinner": "^6.1.6" "react-spinners": "^0.13.8",
```

carousel

```
"react-slick": "^0.30.1", "slick-carousel": "^1.8.1",
```

chat

```
"socket.io-client": "^4.7.2", "react-scroll-to-bottom": "^4.2.0",
```

Settings config.env

🇮🇹 Di file config.env ne ho pensati 2 , sono da creare quindi 2 file : il primo si chiamerà `.env.development` ed avrà nel mio caso co il server in locale che gira su localhost:3005 :

🇬🇧 I thought of 2 config.env files, so 2 files need to be created: the first will be called `.env.development` and in my case will have the local server running on localhost:3005

```
{VITE_APP_BASE_URL=http://localhost:3005/api/v1  
VITE_APP_BASE_URL_SOCKET=http://localhost:3005}
```

🇮🇹 il secondo si chiamerà `.env.production` ed avrà nel mio caso:

🇬🇧 the second will be called `.env.production` and will have in my case:

```
{VITE_APP_BASE_URL=https://s2i-study-buddy-hub-4coach.onrender.com/api/v1  
VITE_APP_BASE_URL_SOCKET=https://s2i-study-buddy-hub-4coach.onrender.com}
```

Deploy on netlify

Deploy for free on netlify.com

if you want to immediately test the on line app : STUDYBUDDYHUB

Installation

First of all, you need Node.js installed.

If you don't have it, you can download it here: [Node.js](https://nodejs.org/)

After the installation, you're ready to go.

1 - Clone the repository

```
git clone https://github.com/boobaGreen/S2INodeJsPOF
```

IMPORTANT!! - NOW go to the FOLDER "front" : `cd back`

2 - Install the dependencies

REMEBER: we are in the "front" folder now!

```
npm install
```

3 - Start it

```
npm run dev
```

 for development mode, open the browser on <http://localhost:4000/>
